

Continuous Improvement Toolkit

Value Analysis

The Continuous Improvement Map

- Value Analysis

Value:

- ❑ One of the most important concepts within Lean.
- ❑ One of the most valuable outcomes Lean provides.
- ❑ **Value Analysis** focuses on what adds value to business processes as perceived by the customer.
- ❑ A process that does not add value to the product or service should be redesigned or eliminated altogether.

- Value Analysis

- Each step within a process can be classified into one of three categories:
 - Value added activities.
 - Essential non-value added activities (or unavoidable wastes).
 - Non-value added activities.

- Value Analysis

Value Added Activities:

- ❑ Increase the worth of a product or services from the customer's perspective.
- ❑ **Common examples include:**
 - Machining a part.
 - Serving a customer at a call center.

- Value Analysis

Essential Non-Value Added Activities:

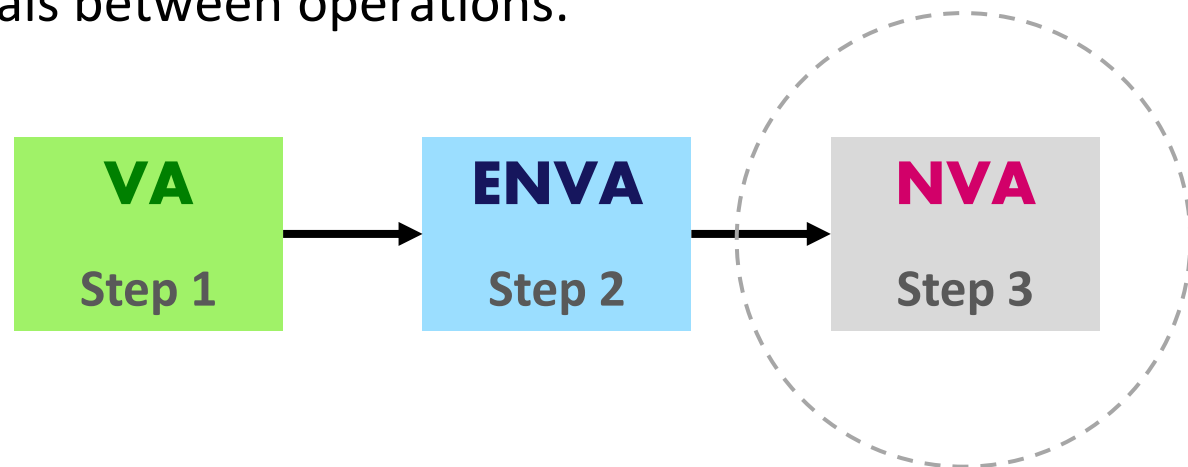

- ❑ Add no value to a product or service.
- ❑ The customer is not willing to pay for them.
- ❑ However, they are necessary for the business due to the current settings of the process.
- ❑ Common examples include: purchasing, R&D and inspecting parts for quality defects.

- Value Analysis

Non-Value Added Activities:

- ❑ Add no value to the product or service.
- ❑ Not required for business operational reasons.
- ❑ Must be eliminated immediately.
- ❑ **Common examples include:**
 - Rework an application form.
 - Handling of materials between operations.
 - Delayed starts.

- Value Analysis

- Researches has shown that value added activities are typically less than **10%** of the total process lead time.
 - The work that the customer cares about is only **10%**.

- Value Analysis

- ❑ The first step when analyzing the value of any process is to determine who the ultimate customer is.
- ❑ An **ultimate customer** is the end user of the product or service.
- ❑ Understand their expectations clearly and know exactly what they are willing to pay for.
- ❑ Listen actively to your customers.
- ❑ Encourage them to send feedback on how well your product or service meets their needs (for future process improvements).

- Value Analysis

- ❑ **Patients** are the ultimate customers in medical services.
- ❑ It is important to provide them with comprehensive and personalized health care.
- ❑ Patients instead often get stuck in processes that don't add value to their primary care:
 - They are often asked to fill out medical forms multiple times.
 - They wait too long to receive a consultation from their primary doctor.

- Value Analysis

- ❑ The traditional approach to process improvement is to focus on reducing the time to perform the value added work.
 - Normally through capital investment.
- ❑ The Lean approach however focuses on eliminating the root causes of the **90%** of the non-value added activities.
 - Much cheaper and more effective.

- Value Analysis

□ Tools to identify and analyze non-value added activities:

- The eight wastes.
- Waste walks.
- Waste recording forms & waste logs.
- Opportunity process map.
- Value matrix.
- Value timeline.
- VA/NVA metrics.

- Value Analysis

The Eight Wastes:

- T**ransport
- I**nventory
- M**otion
- W**aiting
- O**verproducing
- O**ver Processing
- D**efects
- S**kills

- Value Analysis

Waste Walks:

- ❑ Used to quickly identify waste within an area or in a process.
- ❑ Allows walkers to understanding how the process really works.
- ❑ Helps them quickly identify waste and identify continuous improvement opportunities.

Observe the process with an eye
towards waste

- Value Analysis

How to Conduct a Waste Walk:

- ❑ Clearly describe the objective of conducting the waste walk.
- ❑ Select the process or area and define the boundaries.
- ❑ Prepare an observation form to collect the desired information.
- ❑ Get permission from the process owner or supervisor to conduct the walks and talk to the people there.
- ❑ Walk the flow of the process and look for each of the eight types of waste.
- ❑ Collect data, observe actual practices, interview people and ask questions.
- ❑ Identify opportunities to eliminate waste.
- ❑ Prioritize improvement actions as appropriate.

- Value Analysis

Waste Recording Form:

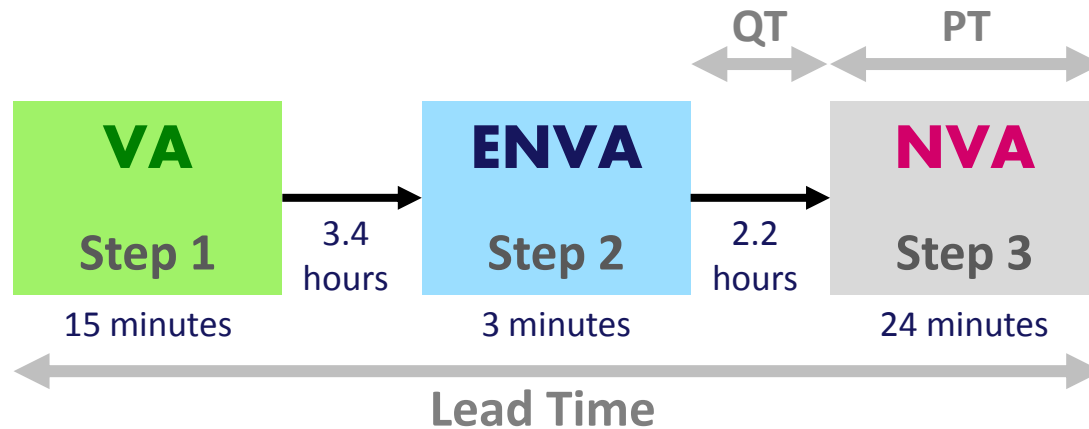

- ❑ Helps identify and record wasteful activities.
- ❑ It usually contains a place to classify the waste according to the eight wastes.
- ❑ It may also contain a place that encourages the team to propose priority areas for action.

Process	Waste Category	Description	Possible Cause	Proposed Action

- Value Analysis

Opportunity Process Map:

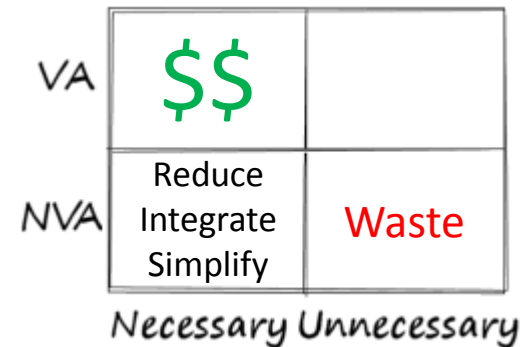

- ❑ Provides a visual picture of how the process works and where wasteful activities exist.
- ❑ A type of process map with additional information about whether activities are value added or non-value added.

- Value Analysis

Value Matrix:

- ❑ Used to help make correct decisions about wasteful and non-value added activities.
- ❑ If the activity is unnecessary and adds no value to the product or service, then you need to eliminate it immediately.
- ❑ If the activity adds no value but is necessary for business operational reasons, then it can be reduced, integrated or simplified to optimize the process.

- Value Analysis

Value Timeline:

- ❑ Reflects the value added and the non-value added activities of the core process.
- ❑ Helps approximating VA and NVA percentages.
- ❑ Placed at the bottom the value stream map.

- Value Analysis

VA/NVA Metrics:

- ❑ Total Value Added Time.
- ❑ Value Stream Ratio (VA%) - The proportion of time spent in the process that a product or service is actually being worked on a way that is adding value.

$$\text{VS Ratio (\%)} = \frac{\text{Total Value Add Time}}{\text{Total Lead Time}}$$
